

Congenital Scoliosis

Condition

A 16 old year boy with history of congenital scoliosis at mid thoracic area. He had sought medical advice and was treated for more than 5 years in a major medical center in Amman, Jordan. He had growing rods inserted 5 years prior to KKT[®] treatment and unfortunately did not deal with the primary pathology.

Medical Assessment

Upon initial examination the patient presented with a shoulder tilt of 10 degrees and a pelvic tilt of 17 degrees.

Treatment Suggestion

Our suggested clinical plan is to address the malalignment of the patients' spine through gently applying the KKT[®] treatment device. Our aim for treatment of adolescent boy was to reduce his disfigured shape and decreasing the need for further surgical interventions.

Results of Treatment

After the first treatment the shoulder tilt was reduced to 5 degrees and the pelvic tilt was reduced to 10 degrees. The patient has continued to show improvement both in measurements and in disfigurement.

KKT[®] Tomorrow's healthcare, Today!

So come in today for a consultation and take the first step to feeling great again. Because life won't wait and neither should you!

Get back to health and get back to being you again.
